/note="Vector: pBluescript II SK+; Site_I: EcoRI; Site_2:
Xho1; The CDNA library was constructed from mRNA isolated
from germinating shocts of 3 day old seedling for the
cultivar Williams B2. The seedlings were germinated in a
growth chamber using germination paper in a solution
containing 100pm auxin. Complementary DNA was synthesized
from mRNA using a primer consisting of a poly(dT) sequence
with a XhoI restriction site. EcoRI adapters were ligated
to the blunt-ended cDNA fragments followed by XhoI
digestion. The cDNA fragments were directionally cloned
into the EcoRI-XhoI restriction site of the pBluescript
vector. The ligated cDNA fragments were transformed into
DH10B host cells (GibcoRL). This library was constructed
in the laboratory of Dr. Randy Shoemaker."

/note="Vector: lambda Zip-Lox; Site_l: Sal; Site_2: Not;
Lambda PRL2 is a cDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were l)
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark- rosettes; 4)
same plants as 3 but aerial tissue (stems, flowers and
siliques. The vector is BRL's lambda Zip-Lox. The cDNA
inserts were directionally cloned with Sal-Not arms using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Newman, T., deBruijn, F.J., Green, P., Keegstra, K., Kende, H., McIntosh, L., Ohlrogge, J., Raikhel, N., Somerville, S., Thomashow, M., Retzel, E. and Somerville, C. Rice is the most important food crop in the world. Half of the world population, especially those inhabiting highly populated areas of the hunid tropics and subtropics, rely on rice as their primary source of carbohydrate.
Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumqamathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae; Ehrhartoideae; Oryzeae; Oryzae; Oryzae; Oryzae; Oryzae; 1 (bases 1 to 871)

Anote="Vector: pasternation; Site_1: ECORI; Site_2: ECORI; Rice is the most important food crop in the world. Half of the world population, especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate.

Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumyanathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa. Nipponbare variety using ECORI as the cloning enzyme. The library contains 55,296 clones with an average insert size
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of 121 Kb providing approximatiby 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 % Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oryza sativa

EcoRI adapters were ligated to the blunt ended CDNA fragments followed by digestion with EcoRI and HindlII. The CDNA framents were directionally cloned into the EcoRI-HindlII restriction site of the [T7T3-Pac vector. The ligated CDNA fragments were transformed into DH10B host cells (Gibco BRL). This library was constructed by Dr. Randy Shoemaker and Dr. John Erpelding."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The 55 kDa violaxanthin de-epoxidase (VDE) (AAW09875) of tobacco catalyses the de-epoxidation of violaxanthin to zeazanthin and antheraxanthin. This system, termed energy dependent non-radiative antheraxanthin. This system, termed energy dependent non-radiative cenergy dissipation or non-photochemical fluorescence quenching, reduces the quantum efficiency of photosystem II [PSII), helping to prevent PSII over-reduction and photoinhibitory damage. The amino acid sequence of the VDE was deduced from an isolated CDNA clone (AAM566242). VDE nucleic acids (see also AAT66241, AAT66243), in sense or antisense orientation, can be used in genetic constructs to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underexpression of VDE increases contends lower in the photosensitivity of a range of crops, trees and ornamentals can be modified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó

The 55 kDa violaxanthin de-epoxidase (VDE) (AAW09874) of romaine lettuce catalyses the de-epoxidation of violaxanthin to zeaxanthin and antheraxanthin. This system, termed energy dependent non-radiative energy dissipation or non-photochemical fluorescence quenching, reduces the quantum efficiency of photosystem II (PSII) the print to prevent PSII over-reduction and photoinhibitory damage. The amino acid sequence of the VDE was deduced from an isolated CDNA clone (AAT66241). VDE nucleic acids (see also AAT66242-43), in sense or antisense orientation, can be used in genetic constructs to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underspression of VDE increases photosynthetic efficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding plant violaxanthin de-epoxidase - used to modify the sensitivity of a plant to light

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 catalyses the de-epoxidation of violaxanthin to zeaxanthin and antheraxanthin. This system, termed energy dependent non-radiative energy dissipation or non-photochemical fluorescence quenching, reduces the quantum efficiency of photosystem II (PSII), helping to prevent PSII over-reduction and photoinhibitory damage. The amino acid sequence of the VDE was deduced from an isolated cDNA clone (ART66241). VDE nucleic acids (see also AAT66241-42), in sense or antisense orientation, can be used in genetic constructs to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underexpression of VDE increases a photosynthetic efficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be modified.
                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding plant violaxanthin de-epoxidase - used to modify the

The present sequence is a MIM protein from Arabidopsis thaliana, which contributes to recombination repair of DNA damage in plant cells. The protein was tracked down with the help of a T-DNA tagged Arabidopsis mutant showing hypersensitivity to methyl methanesulphonate (MMS). It shows homology to a member of SMC (Structural Maintenance of Chromosomes) protein family and confers hypersensitivity to treatment with MMS, X-rays, UV light or mitomycin C. The present sequence is useful for DNA repair in plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /label= DA-box

This sequence corresponds to a Plasmodium falciparum strain K1

pre-erythrocytic liver stage antigen 3 (LSA-3) protein. The encoding
gene sequence was isolated by screening a P. falciparum strain T9/96
library with serum from a missionary treated by prophylaxis (for strain
T6/96 see FR9101286). Of 20 clones isolated, clone 7295 was used to
screen a library generated from Thai strain K1. One clone contained a
6.85 kb insert including the genomic sequence AAT78667. The gene
comprises a 1.8 kb region encoding 3 major blocks of tetrapeptide
comprises a 1.8 kb region encoding 3 major blocks of tetrapeptide

```
ARR72829 is human mitosin. Mitosin is involved in the regulation of the mammalian mitotic cell cycle. Mitosin as with E2F-1 (see AAR72824) interacts with the retinoblastoma brotein (the retinoblastoma tumour suppressor gene product). Mitosin is first synthesised at the G1/S boundary, it is then phosphorylated from S through M phase, and during mitosis, is closely associated with the centromeres/Kinetochores at the mitosic spindle poles. Mitosin is necessary for a everyvoic cell to enter the M phase of the mitotic cell cycle and its degradation is necessary for a cell to advance on to the next stage. Mitosin is thus useful for controlling cell growth as overexpression of mitosin prevents cell from exiting the M phase.

An anti-mitosin antibody, antibody fragment or a phosphorylated mitosin mutein ( or nucleic acid encoding it) can also be used to inhibit cell division which is particularly useful for the study of the cell cycle. A further use is to control hyperproliferative cells, and so control diseases such as psoriasis and breast cancer. It can also be used to block gametogenesis of an immature gamete.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           60;

The mitosin protein, can be used to control the growth of cells. An antiosin protein, can be used to control the growth of cells. An can initosin antibody, a mutant or a non-functional analogue of mitosin can inhibit the mitotic cell cycle by preventing the cells from entering the M phase, and over expression of mitosin or its functional equivalent, would inhibit the cycle by preventing cells from entering the M phase. Antagonists to this protein can be used to control hyperproliferative cells in, (e.g. thyroid hyperplasia, Grave's disease, psoriasis, benign prostatic hypertrophy, Li-Fraumeni syndrome, breast cancer, sarcomas and other neoplasms, bladder cancer, colon cancer, cancer, sarcomas and other neoplasms, bladder cancer, colon cancer, supplementation of lost mitosin function by introduction of the protein or nucleic acid encoding the protein into a cell can restore defective chromosome segregation, which is a marker of progressing malignancy. Malignant proliferation of cells can then be halted. The protein can also be used for the detection and diagnosis of hyperproliferative

Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection -

Disclosure; Page 410-414; 577pp; English.

by chromosome 2 of the human malarial parasite, hasmodium falciparum.

Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisers or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequenced by its will help to expand our understanding of parasite biology, a process hampered by the cumberate drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new cuts. AAA70078 to AAA70278 and AAB1814 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification. proteins and their fragments (I) encoded present invention describes

```
The human RAD50 (hRAD50) is involved in DNA repair and has tummour suppression activity, can be used to detect predisposition to, decrease the risk of or treat cancers, e.g. acute myeloid leukeamia, myeloid splastic syndrome, therapy related myelodysplastic syndrome, therapy related myelodysplastic syndrome, therapy related acute myeloid leukaemia, refractory anaemia or refractory anaemia with excess blasts. Also disclosed in this invention is Human Septin-2 homologues of which may be used as targets for cancer therapies and central nervous system directed treatment methods, and to measure the proliferative potential of selected cell types.
                                         predisposition to, decrease risk of and treat cancer, also Septin-2
                     Human tumour suppressor gene RAD50 - useful to detect
